10 QUESTIONS FOR A LARGE COMPANY ABOUT ITS BUSINESS SOFTWARE

Is your business software ready to put AI to work in every department, under the controls your auditors expect?

Your business software is everything your company runs on: customer records, sales, finance, human resources, operations, and the data in all of them. In a large company it is spread across platforms, departments, and vendors, each with its own rules, and AI added on top inherits all of it. Every "no" below is a place where AI will break, or where you cannot answer to your auditors.

1. **Do you know which AI tools your employees use today, what company data they see, and what they cost?** ☐
   When every employee has their own chat window, nobody knows who is spending what.
2. **Does AI see only what it needs to know, just like employees?** ☐
   One set of permissions for people and AI, across every department.
3. **Does every customer exist once, across every department, across the entire company?** ☐
   Or does sales, service, and finance each keep its own version of the same customer?
4. **Could you show an auditor every action taken in your business software, by a person or by AI, and undo any of it?** ☐
   Who did what, when, with whose approval, and what was there before.
5. **Can you choose where your business software and data live: your own cloud account or your own servers?** ☐
   Or does the vendor decide for you?
6. **Could you leave your current software vendor and keep running?** ☐
   With your data, your setup, and the source code.
7. **When your approved list of AI models changes, can your business software switch without a rebuild?** ☐
   Models improve every few months, and approved lists change with them.
8. **Do you control what happens to your software bill as you add employees and bring AI to all of them?** ☐
   Most enterprise software charges for every person who signs in.
9. **Can you test a new version of your business software before it reaches your people?** ☐
   Updates should never surprise the people who depend on them.
10. **When your business software breaks, who answers, and how fast?** ☐
    A named team under a service agreement, or a ticket queue?

How did you do?

9 or 10 "yes"
Ready. AI can work in every department, under control.

6 to 8 "yes"
AI will help in places, and create risk where the gaps are.

5 or fewer
AI will stay a pilot until your business software is brought together.

What to do next

Ulmero is a business operating system: one system for all of it, with AI working inside it, safely, on infrastructure you control.

LARGE COMPANIES AND ENTERPRISES

See one customer's whole history and a restore from the record of every change, then plan it with Ulmero's team, using your own departments, rules, and systems.
