10 QUESTIONS TO ASK ABOUT YOUR BUSINESS SOFTWARE

Are you ready to integrate AI into your business properly, instead of bolting it onto scattered systems?

Your business software is everything your company runs on: customer records, sales, finance, human resources, operations, and the data in all of them. AI is only as good as the software underneath it. If your customers, your data, and your permissions are scattered across a dozen services, AI bolted on top inherits the mess. Answer these ten questions honestly. Every "no" is a place where AI will break, or where you cannot trust it.

1. **Does every customer exist once?** ☐
   Or is the same person scattered across a dozen services, each with its own version?
2. **Can you see your whole business in one place?** ☐
   Or does every report mean exporting spreadsheets from separate apps?
3. **Does everyone, people and AI, see only what they need to know?** ☐
   One set of permissions across your whole business, not a different one in every tool.
4. **Is every change recorded, and can you undo it?** ☐
   Could you show an auditor who did what, when, and with whose approval?
5. **Who owns your business software?** ☐
   If a vendor disappears, raises prices, or changes the rules, can you keep running?
6. **Where does your data live, and do you get to choose?** ☐
   The vendor's servers, your cloud account, or your own servers.
7. **Can AI do routine work across your whole business, under the same rules as your people?** ☐
   Or is it stuck answering questions in a chat window?
8. **Can you change which AI model you use without rebuilding your business software?** ☐
   Models improve every few months. You should not be locked to one.
9. **When your business software breaks or you outgrow it, who fixes it, and how fast?** ☐
   A demo built in a weekend has no one on call.
10. **Will your business software still work at ten times your size?** ☐
    Without a new system, a migration, or a fee for every new user.

How did you do?

9 or 10 "yes"
Your business software is ready. AI can work across your business safely.

6 to 8 "yes"
AI will help in places, and break where the gaps are.

5 or fewer
AI will stay a toy until your business software is brought together.

What to do next

Ulmero is a business operating system: one system for all of it, with AI working inside it, safely, on infrastructure you control.

STARTUPS, SMALL AND MEDIUM BUSINESSES

See your company running on Ulmero. Answer a few questions in the Setup Interview. It starts read-only, so nothing changes until you say so.
